IMPROVING EARLY DETECTION OF DEMENTIA IN OLDER ADULTS WITH THE GSA KAER FRAMEWORK

ABOUT US

The Gerontological Society of America KAER Toolkit for Brain Health is intended to support interdisciplinary care teams in implementing a comprehensive approach to initiating conversations about brain health, detecting and diagnosing dementia, and providing individuals and their care partners with community-based supports. The Toolkit provides practical methods, educational resources, and validated clinical tools for team integration. Session participants will familiarize themselves with the KAER Framework, navigate the virtual KAER Toolkit for Brain Health, and learn to enhance brain health discussions and caregiving for older adults with dementia.
